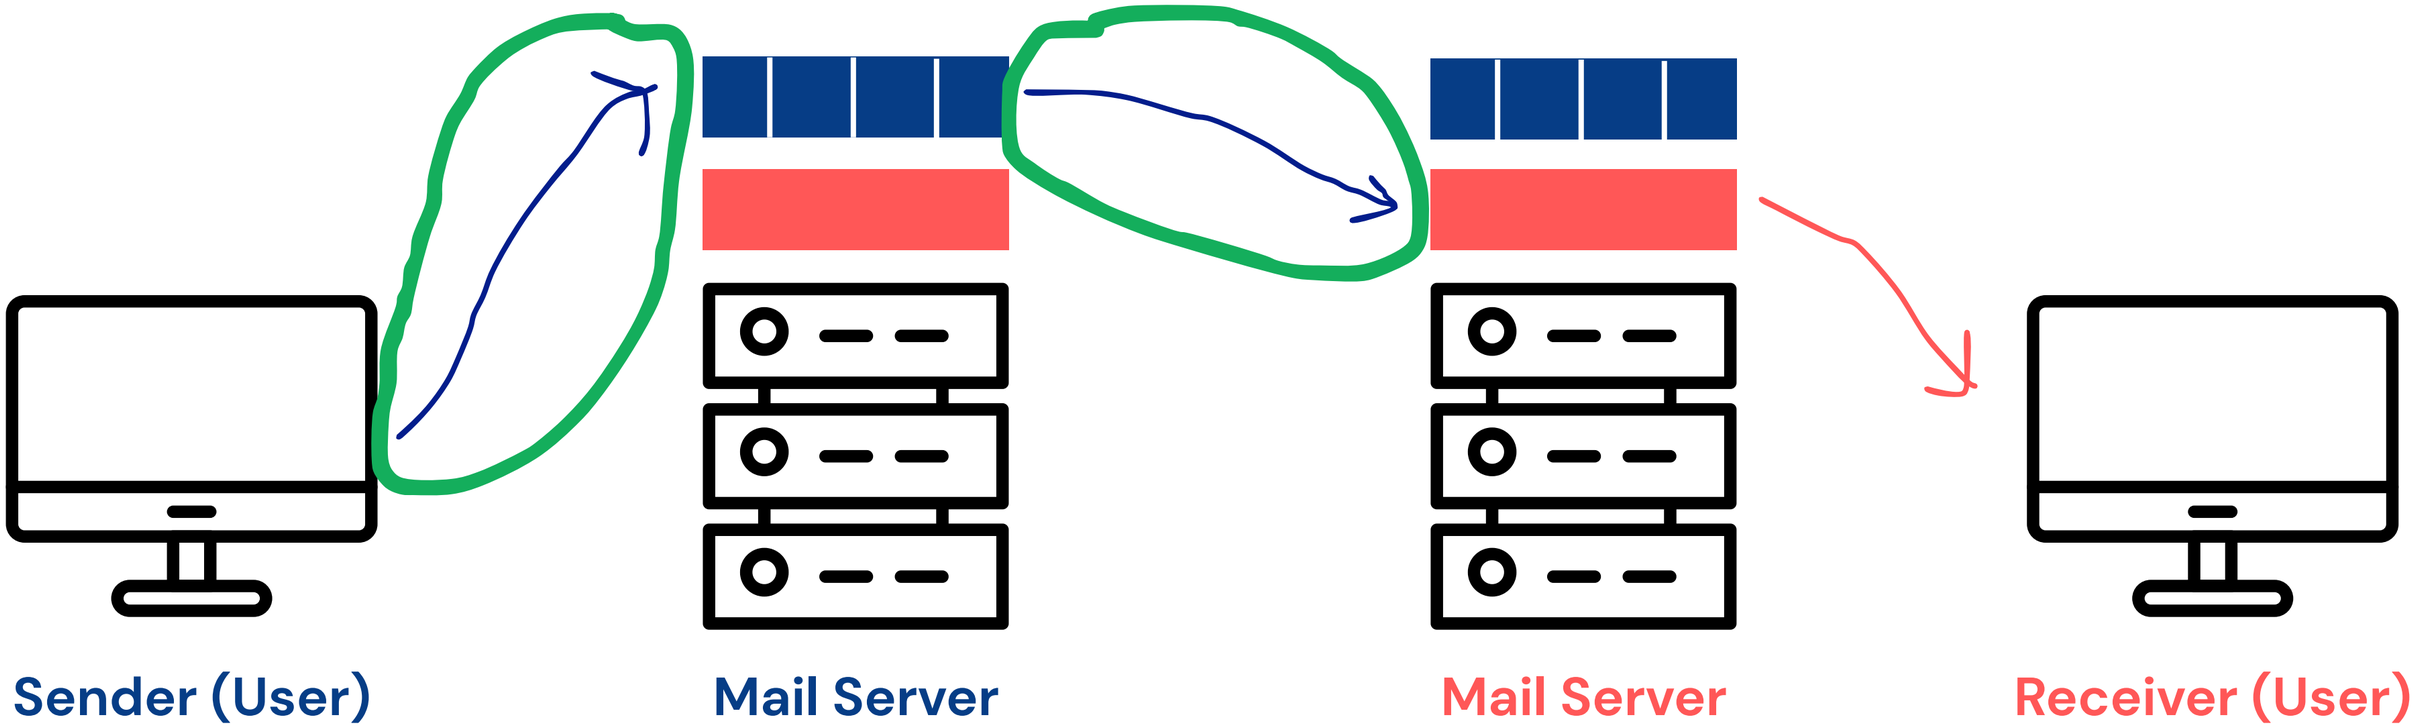
Fundamental Difference with HTTP

HTTP → Client pull

Here → Client push



SMTP

Simple Mail Transfer Protocol

SMTP

Simple Mail Transfer Protocol

- Push Protocol (Otherwise recipient server had to ask every servers if they got any message for it constantly)

SMTP

Simple Mail Transfer Protocol

- Push Protocol (Otherwise recipient server had to ask every servers if they got any message for it constantly)
- Built for asynchronous communication. It can queue messages and retry multiple times if failed.

SMTP

Simple Mail Transfer Protocol

- Push Protocol (Otherwise recipient server had to ask every servers if they got any message for it constantly)
- Built for asynchronous communication. It can queue messages and retry multiple times if failed.
- SMTP predates HTTP. Most of servers were already using SMTP.

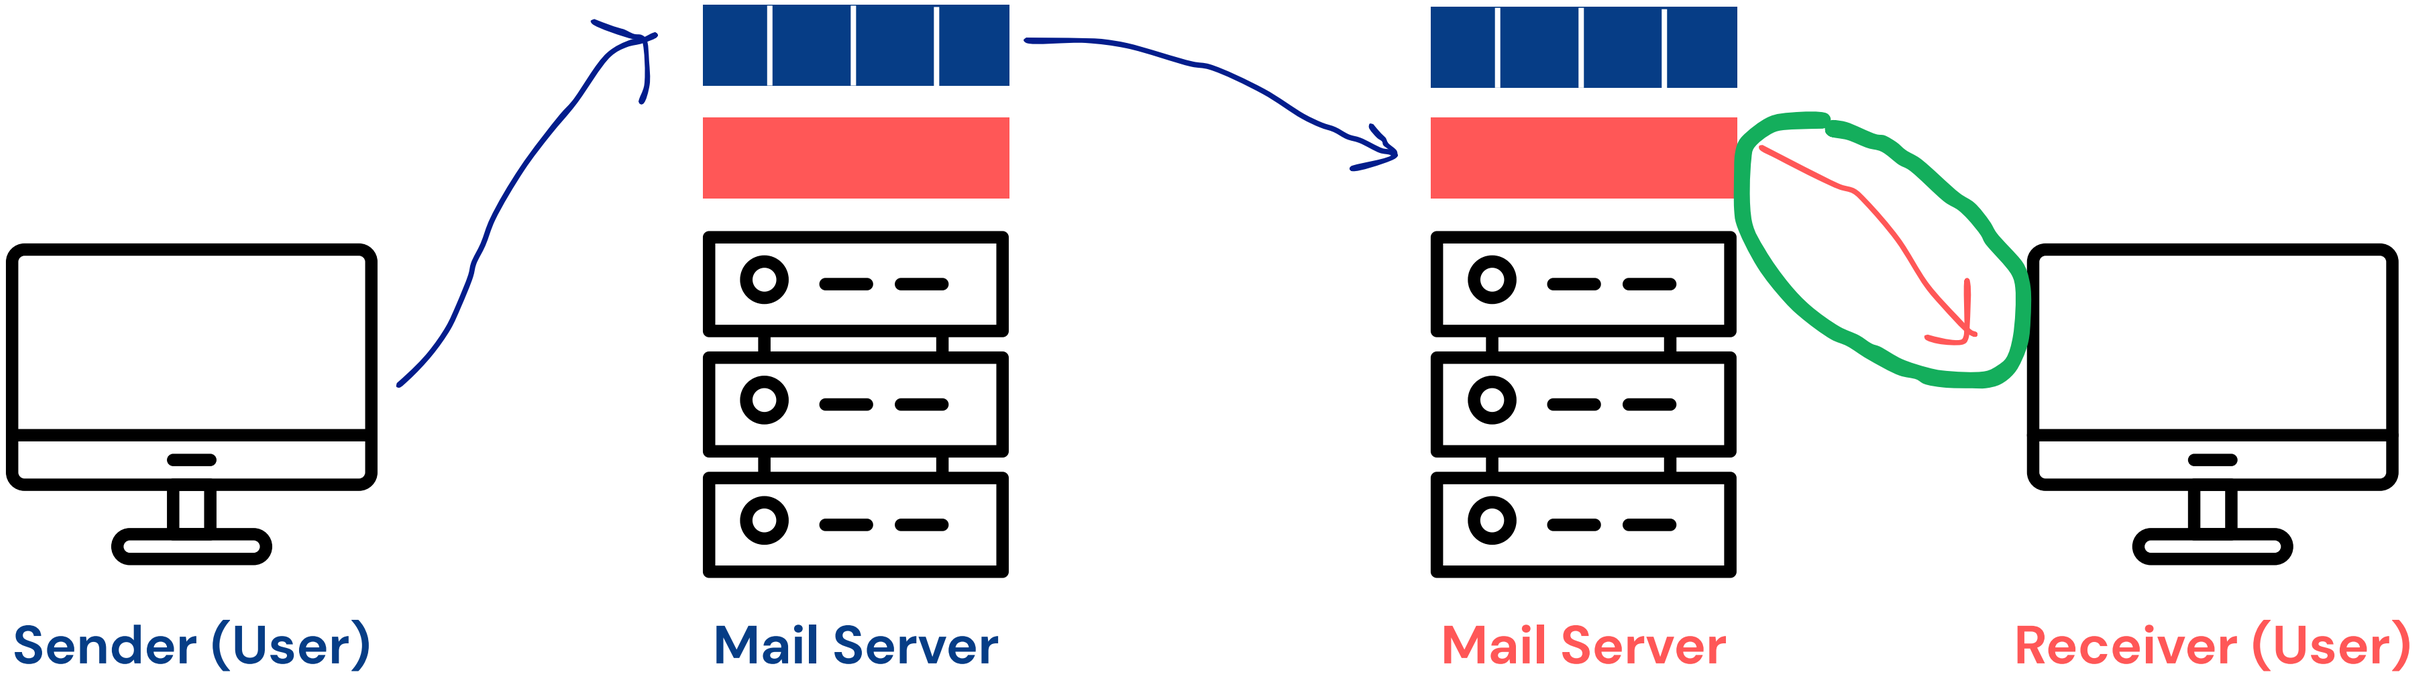
SMTP

Simple Mail Transfer Protocol

- Push Protocol (Otherwise recipient server had to ask every servers if they got any message for it constantly)
- Built for asynchronous communication. It can queue messages and retry multiple times if failed.
- SMTP predates HTTP. Most of servers were already using SMTP.

Nowadays, communicating mail server from web browsers uses HTTP/HTTPS

Accessing Emails



Accessing Emails

IMAP (Internet Message Access Protocol)

- Synchronization between multiple devices
- Selective downloading
- Manages folders, flags etc

Accessing Emails

IMAP (Internet Message Access Protocol)

- Synchronization between multiple devices
- Selective downloading
- Manages folders, flags etc

POP3 (Post Office Protocol v3)

- Good for single device access
- Deletes from server after download
